

DOCUMENT 1

QUALIFYAI — PRODUCT & FUNCTIONAL BLUEPRINT

Project: QualifyAI

Document: Document 1 — Product & Functional Blueprint

Document Type: Product / Functional Specification

Status: Foundation Specification

Version: 1.0

1. DOCUMENT OVERVIEW

This document defines the complete product and functional blueprint of **QualifyAI**, an AI-powered technical recruitment and interview assessment platform.

The purpose of this document is to establish a single functional reference for understanding what QualifyAI is, who uses it, how the platform operates, and what capabilities the system must provide.

QualifyAI is designed as a dual-sided platform serving both **recruiters/organizations** and **candidates**.

The recruiter side focuses on transforming a Job Description into a structured technical assessment, inviting candidates, conducting AI-powered interviews, evaluating candidates, and analyzing results.

The candidate side provides an interactive AI-powered technical interview experience with real-time voice conversation, adaptive questioning, and post-interview diagnostic feedback.

The central product concept is:

This document establishes the functional foundation upon which the technical architecture, frontend design, database architecture, and implementation documentation will be developed.

2. PRODUCT VISION

QualifyAI aims to transform technical recruitment from a largely manual and inconsistent screening process into a structured, intelligent, and scalable assessment workflow.

Traditional technical recruitment frequently requires recruiters and interviewers to manually:

- understand a Job Description,
- determine relevant technical skills,
- prepare interview questions,
- conduct interviews,
- evaluate responses,
- compare candidates,
- document interview results,
- and communicate feedback.

QualifyAI brings these activities into a unified platform.

The platform uses the Job Description as the foundation for assessment generation and connects it with an AI-powered conversational interview engine.

The intended product experience is:

From Job Description to Intelligent Technical Evaluation.

3. PROBLEM STATEMENT

Technical recruitment contains several recurring challenges.

3.1 Manual Screening

Recruiters may spend substantial time reviewing candidates and determining whether their skills align with a specific role.

3.2 Inconsistent Interviews

Different interviewers may ask different questions and evaluate candidates using different standards.

This can make candidate comparison difficult.

3.3 Generic Technical Assessments

Generic interview questions may not accurately reflect the requirements of a specific position.

A backend developer, data engineer, frontend engineer, and DevOps engineer should not receive the same assessment structure.

3.4 Interviewer Availability

Technical interviews depend heavily on the availability of interviewers.

This creates scheduling constraints and limits how many candidates can be evaluated simultaneously.

3.5 Evaluation Subjectivity

Human evaluation can vary between interviewers.

Without a structured rubric, two candidates with similar performance may receive substantially different evaluations.

3.6 Limited Candidate Feedback

Candidates often receive only a final selection/rejection outcome without a detailed explanation of their technical performance.

3.7 Scaling Technical Assessment

Organizations may struggle to conduct large numbers of technical assessments while maintaining consistency and quality.

4. PROPOSED SOLUTION

QualifyAI addresses these challenges by creating an integrated AI-powered technical assessment pipeline.

The platform allows a recruiter to provide a Job Description.

QualifyAI then analyzes the role requirements and generates a structured assessment framework.

The generated framework can include:

- required technical skills,
- role-specific evaluation criteria,
- technical topics,
- interview questions,
- expected knowledge areas,
- scoring dimensions,
- and follow-up directions.

The candidate subsequently participates in an AI-powered technical interview.

The interview engine conducts a conversational interaction rather than simply presenting a static questionnaire.

Candidate responses are transcribed, analyzed, and evaluated.

The system can adapt subsequent questions based on the candidate's previous response and the role-specific assessment context.

At the end of the assessment, QualifyAI produces structured evaluation information for recruiters and diagnostic feedback for candidates.

5. PRODUCT OBJECTIVES

The primary objectives of QualifyAI are:

5.1 Automate Technical Screening

Reduce the amount of repetitive manual work required for initial technical assessment.

5.2 Standardize Evaluation

Use role-specific rubrics to create a consistent evaluation framework.

5.3 Make Interviews Conversational

Provide candidates with a natural AI voice interview rather than a purely static questionnaire.

5.4 Enable Adaptive Assessment

Allow interview questions and follow-ups to respond to candidate performance.

5.5 Generate Actionable Evaluation

Produce structured technical and communication evaluation rather than only a pass/fail result.

5.6 Improve Candidate Feedback

Provide candidates with meaningful diagnostic information after an interview.

5.7 Enable Recruiter Analytics

Allow recruiters to compare candidates using structured scores, transcripts, reports, and rankings.

5.8 Support Enterprise Scale

Build the system as a multi-tenant SaaS platform capable of supporting multiple organizations.

6. PLATFORM SCOPE

QualifyAI consists of the following major functional areas:

QUALIFYAI

- |
- |— Authentication
- |— Organization Management
- |— Job Management
- |— JD Intelligence
- |— Rubric Generation
- |— Question Generation
- |— Candidate Management
- |— Interview Invitations
- |— AI Interview Engine
- |— Voice Processing
- |— Adaptive Interviewing
- |— Evaluation
- |— Scoring
- |— Proctoring
- |— Reports
- |— Candidate Feedback
- |— Recruiter Analytics
- |— Candidate Ranking

These areas collectively form the core platform.

7. TARGET USERS

QualifyAI primarily serves two user groups.

7.1 Recruiters / Organizations

Recruiters use the platform to:

- create roles,

- upload Job Descriptions,
- generate assessments,
- invite candidates,
- monitor interviews,
- inspect candidate responses,
- review evaluations,
- compare candidates,
- and make informed recruitment decisions.

7.2 Candidates

Candidates use the platform to:

- access invited interviews,
- participate in AI-powered technical interviews,
- communicate through voice,
- answer technical questions,
- respond to adaptive follow-ups,
- complete the assessment,
- and receive diagnostic feedback.

8. USER ROLES

The core role model consists of:

Organization

Candidate

└─ Diagnostic Feedback

The authorization architecture must ensure that users can access only the resources appropriate to their role and organization.

9. RECRUITER / ORGANIZATION WORKFLOW

The recruiter workflow begins with role creation.

The recruiter should not need to manually construct the entire technical assessment from scratch.

The Job Description should act as the primary contextual input for assessment generation.

10. CANDIDATE WORKFLOW

The candidate workflow begins when the candidate receives an interview invitation.

The experience should be designed to minimize unnecessary friction while maintaining assessment integrity.

11. COMPLETE QUALIFYAI SYSTEM WORKFLOW

The complete product workflow is:

RECRUITER
|

12. JOB DESCRIPTION INTELLIGENCE

Job Description intelligence is one of the central capabilities of QualifyAI.

The system receives a Job Description and converts unstructured role information into structured assessment context.

The JD may contain information such as:

- Job title
- Required skills
- Preferred skills
- Experience
- Responsibilities
- Technical technologies
- Qualifications
- Domain requirements
- Role expectations

The system should transform these inputs into structured requirements.

13. JD PARSING & REQUIREMENT EXTRACTION

The JD processing pipeline should conceptually operate as:

The extracted information becomes contextual input for subsequent AI components.

The system should distinguish between:

- mandatory requirements,
- preferred requirements,
- technical skills,
- experience requirements,
- and role responsibilities where the source JD provides enough information.

14. RUBRIC GENERATION

QualifyAI generates a role-specific evaluation rubric from the Job Description.

The rubric defines how candidate performance should be assessed.

A rubric may contain dimensions such as:

- Technical correctness
- Technical depth
- Problem-solving ability
- Communication clarity
- Role-specific competency

The exact evaluation dimensions should remain configurable as the product evolves.

The rubric should establish a consistent evaluation framework for candidates applying to the same role.

15. QUESTION GENERATION

After rubric generation, QualifyAI generates technical interview questions.

Questions should be grounded in the Job Description and assessment rubric.

The system should support questions that evaluate:

- foundational knowledge,
- practical understanding,
- technical reasoning,
- problem solving,
- role-specific knowledge,
- and deeper understanding.

The question-generation system should avoid producing a completely generic interview unrelated to the role.

16. CANDIDATE MANAGEMENT

Recruiters should be able to manage candidates associated with a job.

Candidate management may include:

- candidate identity
- application association
- interview status
- invitation status
- assessment status
- interview completion
- evaluation status
- score
- ranking
- report availability

Candidate data must remain isolated by organization.

17. INTERVIEW INVITATION

Recruiters should be able to invite candidates to an assessment.

The invitation workflow should establish:

The invitation system should maintain the relationship between:

18. AI TECHNICAL INTERVIEW

The AI interview is the primary candidate-facing assessment experience.

Unlike a static questionnaire, the interview should operate as an interactive conversation.

The AI interviewer should:

- introduce the interview,
- ask technical questions,
- listen to candidate responses,
- understand responses,
- determine appropriate follow-ups,
- continue the interview,
- and conclude the assessment.

The interview context should remain aware of:

- Job Description
- rubric

- generated questions
 - previous candidate responses
 - interview progress
 - evaluation context
-

19. REAL-TIME VOICE CONVERSATION

QualifyAI is designed around real-time voice interaction.

The conceptual communication loop is:

The target is a conversational experience with low perceived latency.

The project documentation identifies a target of approximately **sub-1.5-second round-trip voice interaction**.

This is a project target, not an assertion of an already-achieved production measurement.

20. ADAPTIVE INTERVIEWING

Adaptive interviewing is a core differentiator of QualifyAI.

The system should not necessarily follow a completely rigid question sequence.

Candidate responses can influence subsequent questions.

Conceptually:

For example, a strong answer may lead toward deeper technical exploration, while an incomplete answer may lead toward clarification or foundational follow-up.

The adaptive behavior must remain aligned with the role rubric.

21. SPEECH-TO-TEXT

The voice interview requires speech recognition.

The documented technology direction includes **Deepgram Nova-2** for Speech-to-Text.

The STT layer should transform candidate speech into text that can be consumed by:

- interview reasoning,
- transcript generation,
- evaluation,
- communication analysis.

The provider-specific implementation should remain isolated behind an integration boundary.

22. LLM INTERVIEW REASONING

The LLM is responsible for intelligent interview reasoning.

The documented technology direction includes OpenAI and Gemini-based LLM capabilities.

The reasoning layer may be responsible for:

- understanding candidate responses,
- selecting the next question,
- generating follow-ups,
- maintaining interview context,
- supporting evaluation,
- and producing structured reasoning signals.

LLM output must be constrained by the interview context and rubric rather than treated as unrestricted conversation.

23. TEXT-TO-SPEECH

QualifyAI uses text-to-speech to provide the AI interviewer with a spoken response.

The documented technology direction includes **ElevenLabs**.

The conceptual flow is:

```
graph TD; A[LLM Response] --> B[TTS Service]; B --> C[Generated Speech]; C --> D[Candidate];
```

The TTS layer should be replaceable independently from the interview orchestration logic.

24. INTERVIEW CONTEXT & CONVERSATION MEMORY

The interview engine must maintain sufficient context throughout an interview.

Context may include:

- role information,
- Job Description,
- rubric,
- question plan,
- previous questions,
- candidate responses,
- transcript,
- interview progress,
- evaluation signals.

The system must ensure that the AI interviewer does not lose the relationship between the conversation and the original role requirements.

25. TECHNICAL EVALUATION

After and during the interview, QualifyAI evaluates candidate performance.

The technical evaluation should focus on:

- correctness,
- depth,
- reasoning,
- problem solving,
- role-specific knowledge,
- response quality.

Evaluation should be grounded in the role-specific rubric.

The goal is not merely to determine whether a candidate spoke fluently, but whether the candidate demonstrated relevant technical competency.

26. COMMUNICATION EVALUATION

QualifyAI can evaluate communication-related characteristics from the interview.

Documented metrics include:

- communication clarity,
- words per minute,
- filler-word density.

These metrics should supplement rather than replace technical evaluation.

A candidate's communication performance should not be treated as a direct substitute for technical competence.

27. SCORING SYSTEM

QualifyAI uses a structured scoring model.

The documented product direction includes a **0–100 scoring framework**.

Scores should be derived from the role-specific evaluation criteria.

Conceptually:

The system should preserve enough underlying information for the score to be explainable.

28. INTERVIEW TRANSCRIPT

Each completed interview should produce a structured transcript.

The transcript should preserve the conversational sequence.

Conceptually:

AI Question
Candidate Response
AI Follow-Up
Candidate Response
AI Question
Candidate Response
...

The transcript can support:

- recruiter review,
- evaluation,
- candidate feedback,
- auditability,
- report generation.

Access to transcripts must follow authorization and tenant-isolation rules.

29. PROCTORING & ASSESSMENT INTEGRITY

QualifyAI includes interview integrity monitoring.

Potential signals include:

- browser visibility changes,
- focus loss,
- tab switching,
- acoustic anomalies,
- possible secondary voices.

These events can contribute to an overall integrity/risk assessment.

The integrity system should remain separate from the technical evaluation engine.

Important Product Boundary

QualifyAI should **not use facial-expression or micro-expression analysis as a core candidate evaluation mechanism.**

The assessment focuses on:

- semantic correctness,
 - technical reasoning,
 - communication,
 - and interview integrity signals.
-

30. CANDIDATE DIAGNOSTIC REPORT

After completing the assessment, the candidate can receive diagnostic feedback.

The report may summarize:

- overall performance,
- technical strengths,
- technical weaknesses,
- communication observations,
- relevant scoring,
- areas for improvement.

The documented product direction includes a diagnostic PDF report.

The report should be useful as feedback rather than simply presenting a numerical score.

31. RECRUITER DASHBOARD

The recruiter dashboard provides a centralized view of assessment activity.

It should support visibility into:

- jobs,
- invited candidates,
- interview status,
- completed interviews,

- scores,
- rankings,
- reports,
- transcripts,
- evaluation information,
- assessment activity.

The dashboard should help recruiters move from raw interview data to actionable candidate decisions.

32. CANDIDATE RANKING & LEADERBOARD

QualifyAI should allow recruiters to compare candidates associated with a role.

Candidate ranking may use:

- overall score,
- technical performance,
- communication metrics,
- rubric performance,
- integrity information,
- other documented assessment signals.

The ranking system must remain role-specific.

A candidate's ranking for one job should not automatically be treated as their ranking for another role.

33. ANALYTICS

Recruiter analytics should provide structured visibility into assessment results.

Potential analytics include:

- candidate score distribution,
- assessment completion,
- technical performance,

- communication metrics,
- candidate comparisons,
- interview status,
- ranking information.

Analytics should be generated from authorized organization data.

34. MULTI-TENANT ORGANIZATION MODEL

QualifyAI is designed as a multi-tenant SaaS platform.

The fundamental hierarchy is:

Each organization's resources must remain isolated from other organizations.

Tenant isolation must be enforced at the backend and database/security layers.

35. AUTHENTICATION & AUTHORIZATION

QualifyAI uses Supabase Auth/JWT according to the documented technology direction.

Authentication establishes user identity.

Authorization determines what that user can access.

The platform must enforce authorization for:

- jobs,
- candidates,
- interviews,
- transcripts,
- evaluations,
- reports,
- organization resources.

Frontend restrictions alone are insufficient.

36. DATA & DOCUMENT MANAGEMENT

QualifyAI handles multiple categories of information.

These can include:

Recruitment Data

- Job Descriptions
- requirements
- candidate information
- invitations

Interview Data

- questions
- responses
- transcripts
- interview metadata

Assessment Data

- rubric results
- scores
- communication metrics
- integrity signals
- evaluation results

Generated Artifacts

- diagnostic reports
- recruiter reports
- interview records

Sensitive data must be protected using appropriate authentication, authorization, storage, and tenant-isolation mechanisms.

37. NOTIFICATION / INVITATION SYSTEM

The platform requires mechanisms for communicating interview invitations and relevant assessment events.

The invitation lifecycle should conceptually be:

The specific notification channels can evolve according to the implementation roadmap.

38. END-TO-END USER JOURNEY

Recruiter Journey

Upload JD
↓
Review Extracted Requirements
↓
Generate Rubric
↓
Generate Questions
↓
Invite Candidates
↓
Monitor Interviews
↓
Review Results
↓
Compare Candidates
↓
View Reports
↓
Make Recruitment Decision

Candidate Journey

Receive Invitation
↓
Open Interview
↓
Prepare Microphone / Environment
↓
Start Interview
↓
AI Introduction
↓
Technical Conversation
↓
Adaptive Follow-Ups
↓
Complete Interview
↓
Receive Diagnostic Feedback

39. FUNCTIONAL REQUIREMENTS

FR-01 — Authentication

The system shall provide secure authentication for supported users.

FR-02 — Organization Access

The system shall associate recruiter resources with an organization.

FR-03 — Job Creation

Recruiters shall be able to create technical job assessments.

FR-04 — JD Input

The system shall accept Job Description information.

FR-05 — JD Parsing

The system shall process Job Description information into structured requirements.

FR-06 — Rubric Generation

The system shall generate a role-specific evaluation rubric.

FR-07 — Question Generation

The system shall generate technical interview questions aligned with the role.

FR-08 — Candidate Invitation

Recruiters shall be able to invite candidates to assessments.

FR-09 — AI Interview

Candidates shall be able to participate in an AI-powered technical interview.

FR-10 — Voice Interaction

The interview shall support real-time voice interaction according to the implemented voice architecture.

FR-11 — Transcription

Candidate speech shall be converted into textual transcript data.

FR-12 — Adaptive Follow-Up

The interview engine shall support context-aware follow-up questioning.

FR-13 — Evaluation

Candidate responses shall be evaluated against the assessment context and rubric.

FR-14 — Scoring

The platform shall produce structured candidate scores.

FR-15 — Transcript

Completed interviews shall maintain an accessible transcript for authorized users.

FR-16 — Integrity Monitoring

The platform shall support assessment-integrity signals.

FR-17 — Candidate Report

The platform shall generate candidate diagnostic feedback.

FR-18 — Recruiter Analytics

Recruiters shall be able to inspect structured assessment information.

FR-19 — Candidate Ranking

Recruiters shall be able to compare candidates for a specific role.

FR-20 — Tenant Isolation

Organization data shall remain isolated from other organizations.

40. NON-FUNCTIONAL REQUIREMENTS

40.1 Performance

The system should provide a responsive user experience.

The AI voice pipeline has a documented target of approximately sub-1.5-second round-trip interaction.

40.2 Scalability

The documented project target includes support for **1,000+ simultaneous candidate assessment sessions**.

This is a target capacity and must be validated through performance testing before being considered achieved.

40.3 Reliability

The system should handle failures in external AI services gracefully.

40.4 Security

Authentication, authorization, tenant isolation, and secure data access must be enforced throughout the system.

40.5 Maintainability

The system should use modular domain boundaries and isolated external integrations.

40.6 Observability

The architecture should allow important interview, evaluation, integration, and system events to be traced and investigated.

41. SECURITY REQUIREMENTS

The platform must protect:

- user identities,
- organization data,
- candidate information,
- Job Descriptions,
- transcripts,
- interview recordings where stored,
- evaluation results,
- reports,
- authentication credentials,
- AI provider credentials.

Security controls should include:

- authenticated access,
- role-based authorization,
- tenant isolation,
- secure API validation,
- protected storage,
- secure external integrations,
- secret management,
- controlled report access.

42. PRIVACY & DATA PROTECTION

QualifyAI processes candidate-related assessment information.

Therefore, the architecture must minimize unnecessary data exposure.

Access should follow the principle:

User
↓
Role
↓
Organization
↓
Resource

A user should only receive information required for their authorized task.

Interview transcripts and reports should not be publicly accessible.

43. PERFORMANCE REQUIREMENTS

The primary performance goals include:

- responsive recruiter dashboard,
- low-latency voice interaction,
- efficient transcript processing,
- scalable interview sessions,
- asynchronous processing where appropriate.

The AI voice pipeline should be optimized around the documented target:

STT
≈ sub-300ms target

LLM
≈ 400ms target

TTS
≈ 350ms target

Overall
≈ sub-1.5s target

These figures are architectural performance targets and must be validated during implementation and testing.

44. SCALABILITY REQUIREMENTS

QualifyAI should be capable of scaling independently across major workloads.

Potential scaling boundaries include:

Web/API Traffic
↓
Application Layer
↓
Interview Sessions

Redis/BullMQ may be used for asynchronous workloads where appropriate.

The system should avoid blocking the primary request lifecycle with long-running processing.

45. EXPECTED OUTCOMES

The documented project goals include:

Recruitment Efficiency

Target:

80% reduction in screening time

Voice Experience

Target:

Sub-1.5-second voice interaction

Assessment Scale

Target:

1,000+ simultaneous candidate assessment sessions

Evaluation Standardization

Role-specific rubric-driven evaluation.

Candidate Development

Detailed diagnostic feedback rather than only a final outcome.

These values represent **project goals/targets**, not verified production achievements.

46. CURRENT PRODUCT SCOPE

The current core QualifyAI scope includes:

- ✓ Recruiter Platform
 - ✓ Candidate Platform
 - ✓ Job Description Intelligence
 - ✓ Requirement Extraction
 - ✓ Rubric Generation
 - ✓ Question Generation
 - ✓ AI Voice Interview
 - ✓ Adaptive Interviewing
 - ✓ Speech-to-Text
 - ✓ LLM Reasoning
 - ✓ Text-to-Speech
 - ✓ Technical Evaluation
 - ✓ Communication Metrics
 - ✓ Scoring
 - ✓ Transcripts
 - ✓ Proctoring / Integrity
 - ✓ Candidate Reports
 - ✓ Recruiter Analytics
 - ✓ Candidate Ranking
 - ✓ Multi-Tenant Architecture
 - ✓ Authentication
-

47. FUTURE SCOPE

Potential future enhancements may include:

- multilingual interviews,
- additional AI providers,
- configurable recruiter evaluation criteria,
- enhanced explainable scoring,
- advanced audit trails,
- stronger assessment-integrity mechanisms,
- additional interview formats,
- deeper recruiter analytics,

- expanded enterprise controls.

Future features must not be treated as current functionality until formally adopted into the product requirements.

48. PRODUCT SUCCESS CRITERIA

QualifyAI can be considered functionally successful when:

1. A recruiter can create a role.
2. A recruiter can provide a Job Description.
3. The system can extract meaningful role requirements.
4. A role-specific rubric can be generated.
5. Technical questions can be generated from the role context.
6. Candidates can receive interview invitations.
7. Candidates can participate in the AI interview.
8. Voice interaction operates through the intended real-time pipeline.
9. Candidate responses can be transcribed.
10. The interview can adapt to candidate responses.
11. Candidate performance can be evaluated.
12. Structured scores can be generated.
13. Interview transcripts can be reviewed by authorized users.
14. Integrity events can be recorded.
15. Candidate diagnostic feedback can be generated.
16. Recruiters can compare candidates.
17. Organization data remains isolated.
18. The system remains consistent with the documented architecture.

49. ACCEPTANCE CRITERIA

The product foundation is acceptable when:

Recruiter

- Can authenticate.
- Can access their organization.

- Can create a job.
- Can provide a JD.
- Can generate an assessment.
- Can invite candidates.
- Can inspect completed interviews.
- Can view evaluation results.
- Can compare candidates.

Candidate

- Can access an authorized interview.
- Can complete the interview.
- Can communicate through the supported voice interface.
- Can answer technical questions.
- Can respond to adaptive follow-ups.
- Can complete the assessment.
- Can receive diagnostic feedback.

System

- Maintains interview context.
- Maintains transcripts.
- Produces structured evaluation.
- Supports scoring.
- Records integrity events.
- Maintains tenant isolation.
- Protects sensitive data.
- Maintains documented architectural boundaries.

50. FINAL PRODUCT DEFINITION

QualifyAI is an **AI-powered technical recruitment and interview assessment SaaS platform** that transforms a Job Description into a structured, role-specific technical assessment and uses conversational AI to conduct, evaluate, and analyze candidate interviews.

Its core value chain is:

JOB DESCRIPTION

The fundamental purpose of QualifyAI is therefore not simply to conduct an AI interview.

It is to create a **complete, role-aware technical assessment lifecycle**:

From Job Description → to structured assessment → to conversational AI interview → to explainable evaluation → to actionable recruitment intelligence.

DOCUMENT 1 — END

Document Status: Foundation Product Specification

Primary Purpose: Defines what QualifyAI is and what it must do

Next Document: Document 2 — QualifyAI Full Technical Implementation Plan
